

## TECHNICAL MEMORANDUM

To: Aaron Zimmerman DDOT - PPSA

From: Sidney V. Elam

Maris E. Fry, P.E.

Daniel B. VanPelt, P.E., PTOE

Date: September 29, 2017

Subject: 5000 14<sup>th</sup> Street NW – Supplemental Transportation Review

### INTRODUCTION

This memorandum presents the findings of a supplemental transportation review for the 5000 14<sup>th</sup> Street NW development. This supplemental review serves as an addendum to the Comprehensive Transportation Review (CTR) that reviewed the transportation aspects of the projects Board of Zoning Adjustment (BZA) application (BZA Case Number 19851).

The 5000 14<sup>th</sup> Street site is currently occupied by the Kingsbury Center, which is a private school that serves students with learning differences. Currently, Kingsbury has a student enrollment of 108, ranging from kindergarten to 12<sup>th</sup> grade, and 71 staff members. The proposed plan for the site is to transition the site to the Latin American Bilingual Public Charter School (LAMB). LAMB is expected to start operating out of the 5000 14<sup>th</sup> Street site in fall of 2018, and for an interim period, both LAMB and Kingsbury will occupy the space. During the interim period, the maximum number of students that will occupy the building for both Kingsbury and LAMB will be 485 and the maximum number of faculty/staff for both schools will be 116 (175 students/80 faculty at Kingsbury; 310 students/36 faculty at LAMB). After Kingsbury has fully vacated the property, LAMB proposes to accommodate 600 students and 110 faculty/staff members.

This document was prepared in response to DDOT's request for additional study area intersections during the project's scoping process. These additional intersections could not be incorporated into the original CTR as additional traffic counts could not be collected and processed during the summer months when DC schools were not in session. Additionally, this review addresses issues identified during recent community meetings regarding pedestrian accommodations and school crossings. As such, this memorandum includes the following:

- An overview of trip generation;
- A review of the supplemental capacity analysis and results; and
- A review of potential pedestrian enhancements to serve LAMB and the adjacent West Education Campus.

The following conclusions were made regarding the 5000 14<sup>th</sup> Street NW Supplemental Transportation Review:

- Based on DDOT criteria, the proposed development is not considered to have an impact at any of the additional study area intersections.
- The Applicant is committed to coordinating the process of obtaining at least one crossing guard along the 14<sup>th</sup> Street corridor.
- Overall, this report maintains the conclusions outlined in the full CTR.

## TRIP GENERATION OVERVIEW

As outlined in the full CTR, two trip generation conditions are analyzed for: (1) the interim condition when the two schools are cohabitating the building; and (2) the ultimate condition when only LAMB occupies the building. As such, trip generation was projected for each condition.

Trip generation for the Kingsbury Center was calculated based on data collection at the site driveways on Tuesday, June 6, 2017. Because the school intends to grow as part of the interim condition, the existing driveway counts were factored upwards for both the student and employees. For the purposes of factoring the existing counts, it was assumed that all pick-up/drop-off activity would account for one inbound trip and one outbound trip. As such, additional inbound trips in the morning and additional outbound trips in the afternoon were assumed to be employee trips. Trip generation for LAMB was based on information provided by the school in regard to projected student/employee mode split and start/end times, as well as comparable data from other DC area schools.

Based on this information, and the expected student and faculty populations during the interim and ultimate conditions, the trip generation for both conditions was determined. The trip generation for the interim condition, which includes the interim trip generation for LAMB and the net new trips for Kingsbury, is shown on Table 1. The trip generation for the ultimate condition, which includes the ultimate trip generation for LAMB and the removal of existing Kingsbury trips, is shown on Table 2.

## SUPPLEMENTAL CAPACITY ANALYSIS

This section provides a summary of an analysis of the existing and future roadway capacity at four (4) additional intersections surrounding the site, as requested by DDOT during the scoping process. Included is an analysis of potential vehicular impacts of the 5000 14<sup>th</sup> Street NW development at these intersections.

The purpose of the capacity analysis is to:

- Determine the existing capacity of the supplementary study area intersections;
- Determine the overall impact of the proposed development at the supplementary study area intersections; and
- Discuss potential improvements and mitigation measures to accommodate the additional vehicular trips, if necessary.

This analysis was accomplished by determining the traffic volumes and roadway capacity for existing conditions, background conditions, and future conditions. The capacity analysis focuses on the weekday morning commuter peak hour, afternoon school peak hour, and afternoon commuter peak hour, as determined by the existing traffic volumes in the study area and the proposed land uses of the development.

### ***Study Area & Methodology***

This section outlines the vehicular trips generated along the supplementary study area intersections and defines the analysis assumptions. The scope of the supplementary study area intersections were coordinated with DDOT. The general methodology of the analysis follows national and DDOT guidelines on the preparation of transportation impact evaluations of site development.

### ***Capacity Analysis Scenarios***

Consistent with the 5000 14<sup>th</sup> Street NW CTR submitted to DDOT on September 5, 2017, the roadway capacity analysis examined the following scenarios:

1. 2017 Existing Conditions
2. 2020 Future Conditions without the development (2020 Background Conditions)
3. 2020 Future Conditions with the Interim Conditions (2020 Interim Future Conditions)
4. 2025 Future Conditions with the Interim Conditions (2025 Background Conditions)
5. 2025 Future Conditions with the Ultimate Conditions (2025 Ultimate Future Conditions)

As stated previously, the 2020 interim future condition represents the scenario in which both LAMB and Kingsbury occupy the space and the ultimate condition represents the scenario in which Kingsbury has fully vacated the property and LAMB operates at full capacity.

### ***Study Area***

Based on scoping comments from DDOT, this supplementary analysis includes four additional intersections as outlined below:

1. 16<sup>th</sup> Street & Colorado Avenue, NW
2. 16<sup>th</sup> Street & Blagden Street, NW
3. 16<sup>th</sup> Street & Decatur Street, NW

#### 4. 14<sup>th</sup> Street & Decatur Street, NW

The full CTR includes the capacity analysis results of the remaining 12 study area intersections. Figure 1 shows the additional study area intersections in relation to the original study area intersections included in the full CTR.

#### *Geometry and Operations Assumptions*

The following section reviews the roadway geometry and operations assumptions made and the methodologies used in the roadway capacity analyses.

#### **Existing Geometry and Operations Assumptions**

The geometry and operations assumed in the existing conditions scenario are those present when the data collection occurred. The traffic counts for the additional study area intersections were collected in September of 2017, while the traffic counts for the original study area intersections included in the full CTR were collected in June of 2017. In between these two data collection periods, Emerson Street was converted from two-way operations to one-way operations diverging from 14<sup>th</sup> Street. As such, the traffic counts for the additional study area intersections incorporate the vehicular impacts of the one-way conversion.

The lane configurations and traffic controls for the Existing Conditions are shown on Figure 2.

#### **Background and Future Geometry and Operations Assumptions**

Following national and DDOT methodologies, a background improvement must meet the following criteria to be incorporated into the analysis:

- Be funded; and
- Have a construction completion date prior or close to the proposed criteria.

Based on these criteria, and because the Emerson Street one-way conversion occurred prior to these additional traffic counts, no background improvements were included in the Background or Future Conditions. As such, the lane configurations and traffic controls shown in Figure 2 represent the Existing, Background, and Future Conditions.

#### *Traffic Volume Assumptions*

The following section reviews the traffic volume assumptions and methodologies used in the roadway capacity analyses.

#### **Existing Traffic Volumes**

The existing traffic volumes at the additional intersections are comprised of turning movement count data, which was collected on Thursday, September 14, 2017 between the hours of 6:30 and 9:30 in the morning and 2:00 and 7:00 in the afternoon/evening (in order to obtain the afternoon school peak and the afternoon commuter peak periods). The results of the traffic counts are included in the Technical Attachments. The existing peak hour traffic volumes are shown on Figure 3. For all intersections, the individual morning, afternoon school, and afternoon commuter peak hours were used.

#### **2020 Background Traffic Volumes without the project (2020 Background)**

The traffic projections for the 2020 Background conditions consist of the existing volumes with two additions:

- Traffic generated by developments expected to be completed prior to 2020 (known as background developments); and

- Inherent growth on the roadway (representing regional traffic growth).

Following national and DDOT methodologies, a background development must meet the following criteria to be incorporated into the analysis:

- Be located in the study area, defined as having an origin or destination point within the cluster of study area intersections;
- Have entitlements; and
- Have a construction completion date prior to close to the proposed development.

Based on these criteria, and consistent with the full CTR, no developments were included in the 2020 Background scenario.

While the background developments represent local traffic changes, regional traffic growth is typically accounted for using growth rates. The growth rates used in this analysis are derived using the Metropolitan Washington Council of Government's (MWCOG) currently adopted regional transportation model, comparing the difference between the year 2017 and 2025 model scenarios. The growth rates observed in this model served as a basis for analysis assumptions, and where negative growth was observed, a conservative 0.25 percent annual growth rate was applied to the roadway. A 0.5 percent annual growth rate was applied along 16<sup>th</sup> Street for both travel directions. The applied growth rates are shown in Table 3. Additionally, a 0.25 percent per year growth rate was applied to through traffic along all other study area roadways that were not included in the MWCOG regional transportation model.

**Table 3: Applied Annual and Total Growth Rates**

Road & Direction of Travel	Annual Growth:		Total Growth:	
	2017 to 2025	2017 to 2020	2017 to 2025	2017 to 2025
16th Street NW – Northbound	0.50%	1.51%	4.07%	4.07%
16th Street NW – Southbound	0.50%	1.51%	4.07%	4.07%

The traffic volumes generated by the inherent growth along the network were added to the existing traffic volumes in order to establish the 2020 Background traffic volumes. The traffic volumes for the 2020 Background conditions are shown on Figure 4.

#### **2020 Interim Future Traffic Volumes with Interim Conditions (2020 Interim Future)**

The 2020 Interim Future traffic volumes consist of the 2020 Background volumes with the addition of the traffic volumes generated by the cohabitation of the site by the Kingsbury and LAMB schools during an interim period (Interim Condition site-generated trips). Thus, the 2020 Future traffic volumes include traffic generated by: the existing volumes, the inherent growth on the study area roadways, and Interim Condition site-generated trips of the proposed project.

Trip distribution for the interim site-generated trips for students and employees was determined based on zip code/address data provided by the schools. It was found that the overall distribution of students across the region was very similar for both the Kingsbury and LAMB schools, therefore we are proposing to use the same trip distribution for Kingsbury and LAMB students. Zip code data for employees was only available for LAMB, therefore the employee trip distribution was based on the data supplied and assumed to be similar for Kingsbury employees. Inbound and outbound trip distribution is shown on Figure 5 and Figure 6, respectively.

The traffic volumes for the 2020 Interim Future conditions were calculated by adding the Interim Condition site-generated traffic volumes for the project to the 2020 Background traffic volumes. The interim site-generated traffic volumes are shown on Figure 7 and the 2020 Interim Future traffic volumes are shown on Figure 8.

## **2025 Background Traffic Volumes with Interim Conditions (2020 Background)**

The traffic projections for the 2025 Background conditions consist of the existing volumes with three additions:

- Traffic generated by developments expected to be completed prior to 2025 (known as background developments);
- Traffic generated by the co-occupancy of the site by the Kingsbury and LAMB schools; and
- Inherent growth on the roadway (representing regional traffic growth).

Consistent with the 2020 Background conditions, no developments were included in the 2025 Background scenario and the same background growth rates, shown in Table 3, were used.

The traffic volumes generated by interim site-generated traffic volumes, and the inherent growth along the network were added to the existing traffic volumes in order to establish the 2025 Background traffic volumes. The traffic volumes for the 2025 Background conditions are shown on Figure 9.

## **2025 Total Future Traffic Volumes with Ultimate Conditions (2025 Ultimate Future)**

The 2025 Ultimate Future traffic volumes consist of the 2025 Background volumes and ultimate condition site-generated volumes after Kingsbury has fully vacated the property and the building is fully occupied by LAMB. Thus, the 2025 Future traffic volumes include traffic generated by: the existing volumes, the inherent growth on the study area roadways, and ultimate condition site-generated traffic volumes.

Trip distribution for the total ultimate future site-generated trips is consistent with what is assumed for the interim future site-generated trips as shown on Figure 5 and Figure 6, for inbound and outbound traffic, respectively.

The traffic volumes for the 2025 Ultimate Future conditions were calculated by adding the Ultimate Future conditions site-generated traffic volumes for the project of the 2025 Background traffic volumes. The ultimate site-generated volumes are shown on Figure 10 and the 2025 Total Future traffic volumes are shown on Figure 11.

## ***Vehicular Analysis Results***

### *Intersection Capacity Analysis*

Intersection capacity analyses were performed for the five scenarios outlined previously at the additional study area intersections during the morning commuter peak, afternoon school peak, and afternoon commuter peak hours. Synchro version 9.1 was used to analyze the study intersections based on the *Highway Capacity Manual* (HCM) 2000 methodology.

The results of the capacity analyses are expressed in level of service (LOS) and delay (seconds per vehicle) for each approach. A LOS grade is a letter grade based on the average delay (in seconds) experienced by motorists traveling through an intersection. LOS results range from "A" being the best to "F" being the worst. LOS D is typically used as the acceptable LOS threshold in the District, although LOS E or F is sometimes accepted in urbanized areas if vehicular improvements would be a detriment to safety or non-auto modes of transportation.

The LOS capacity analyses were based on: (1) the peak hour traffic volumes; (2) the lane use and traffic controls; and (3) the Highway Capacity Manual (HCM) methodologies (using *Synchro* software). The average delay of each approach and LOS is shown for the signalized intersections in addition to the overall average delay and intersection LOS grade. The HCM does not give guidelines for calculating the average delay for a two-way stop-controlled intersection, as the approaches without stop

signs would technically have no delay. Detailed LOS descriptions and the analysis worksheets are contained in the Technical Attachments.

Table 4, Table 5, and Table 6 show the results of the capacity analyses, including LOS and average delay per vehicle (in seconds) for the morning peak hour, the afternoon school peak hour, and the afternoon commuter peak hour, respectively. The capacity analysis results are also shown on Figure 12 for the morning peak hour, Figure 13 for the afternoon school peak hour, and Figure 14 for the afternoon commuter peak hour.

The additional study intersections generally operate at acceptable conditions during the morning, afternoon school, and afternoon commuter peak hours for all study scenarios. However, one intersection has at least one approach operate under unacceptable conditions during at least one study scenario and during at least one of the peak hours:

- 16<sup>th</sup> Street & Decatur Street NW

During the morning peak hour, the westbound approach of Decatur Street operates at unacceptable levels during the 2025 Background and 2025 Ultimate Future Conditions. This can be attributed to the relatively low amount of green time allocated to Decatur Street as compared to 16<sup>th</sup> Street. This is typical along primary commuter corridors in which the minor approach is given a lower priority.

### *Queuing Analysis*

In addition to the capacity analyses presented above, a queuing analysis was performed at the additional study area intersections. The queuing analysis was performed using Synchro software. The 50<sup>th</sup> percentile and 95<sup>th</sup> percentile queue lengths are shown for each lane group at the study area signalized intersections. The 50<sup>th</sup> percentile queue is the maximum back of queue on a median cycle. The 95<sup>th</sup> percentile queue is the maximum back of queue that is exceeded 5% of the time. For unsignalized intersection, only the 95<sup>th</sup> percentile queue is reported for each lane group (including free-flowing left turns and stop-controlled movements) based on the HCM 2000 calculations. HCM 2000 does not calculate queuing for all-way stops.

Table 7, Table 8, and Table 9 shows the queuing results for the study area intersections for the morning peak hour, the afternoon school peak hour, and the afternoon commuter peak hour, respectively. Some of the study intersections have one or more lanes group that exceed the given storage length during at least one peak hour in all of the study scenarios. Queuing issues are primarily observed along 16<sup>th</sup> Street and 14<sup>th</sup> Street lane groups. These intersections are as follows:

- 16<sup>th</sup> Street & Colorado Avenue NW
- 16<sup>th</sup> Street & Decatur Street NW
- 14th Street & Decatur Street NW

### ***Mitigations and Improvements***

Based on DDOT standards, the proposed development is considered to have an impact at an intersection within the study area if any of the following conditions are met:

- The capacity analyses show a LOS E or F at an intersection or along an approach where one does not exist in the existing or background conditions;
- There is an increase in delay at any approach or overall intersection operating under LOS E or F of greater than 5 seconds when compared to the background scenario; or

- There is an increase in the 95<sup>th</sup> percentile queues by more than 150 feet at an intersection or along an approach in the future conditions with the proposed development where one does not exist in the background scenario.

Following these guidelines, there are no development-related impacts at any of the additional study area intersections. Although this is the case, capacity concerns that arise in the 2025 Background Conditions at the intersection of 16<sup>th</sup> Street and Decatur Street NW can be improved through minor changes to signal times such that a few more seconds of green time is allocated to Decatur Street.

This report concludes that the development will not have a detrimental vehicular impact to the additional study area intersections and does not recommend any intersection mitigations to be performed by the Applicant.

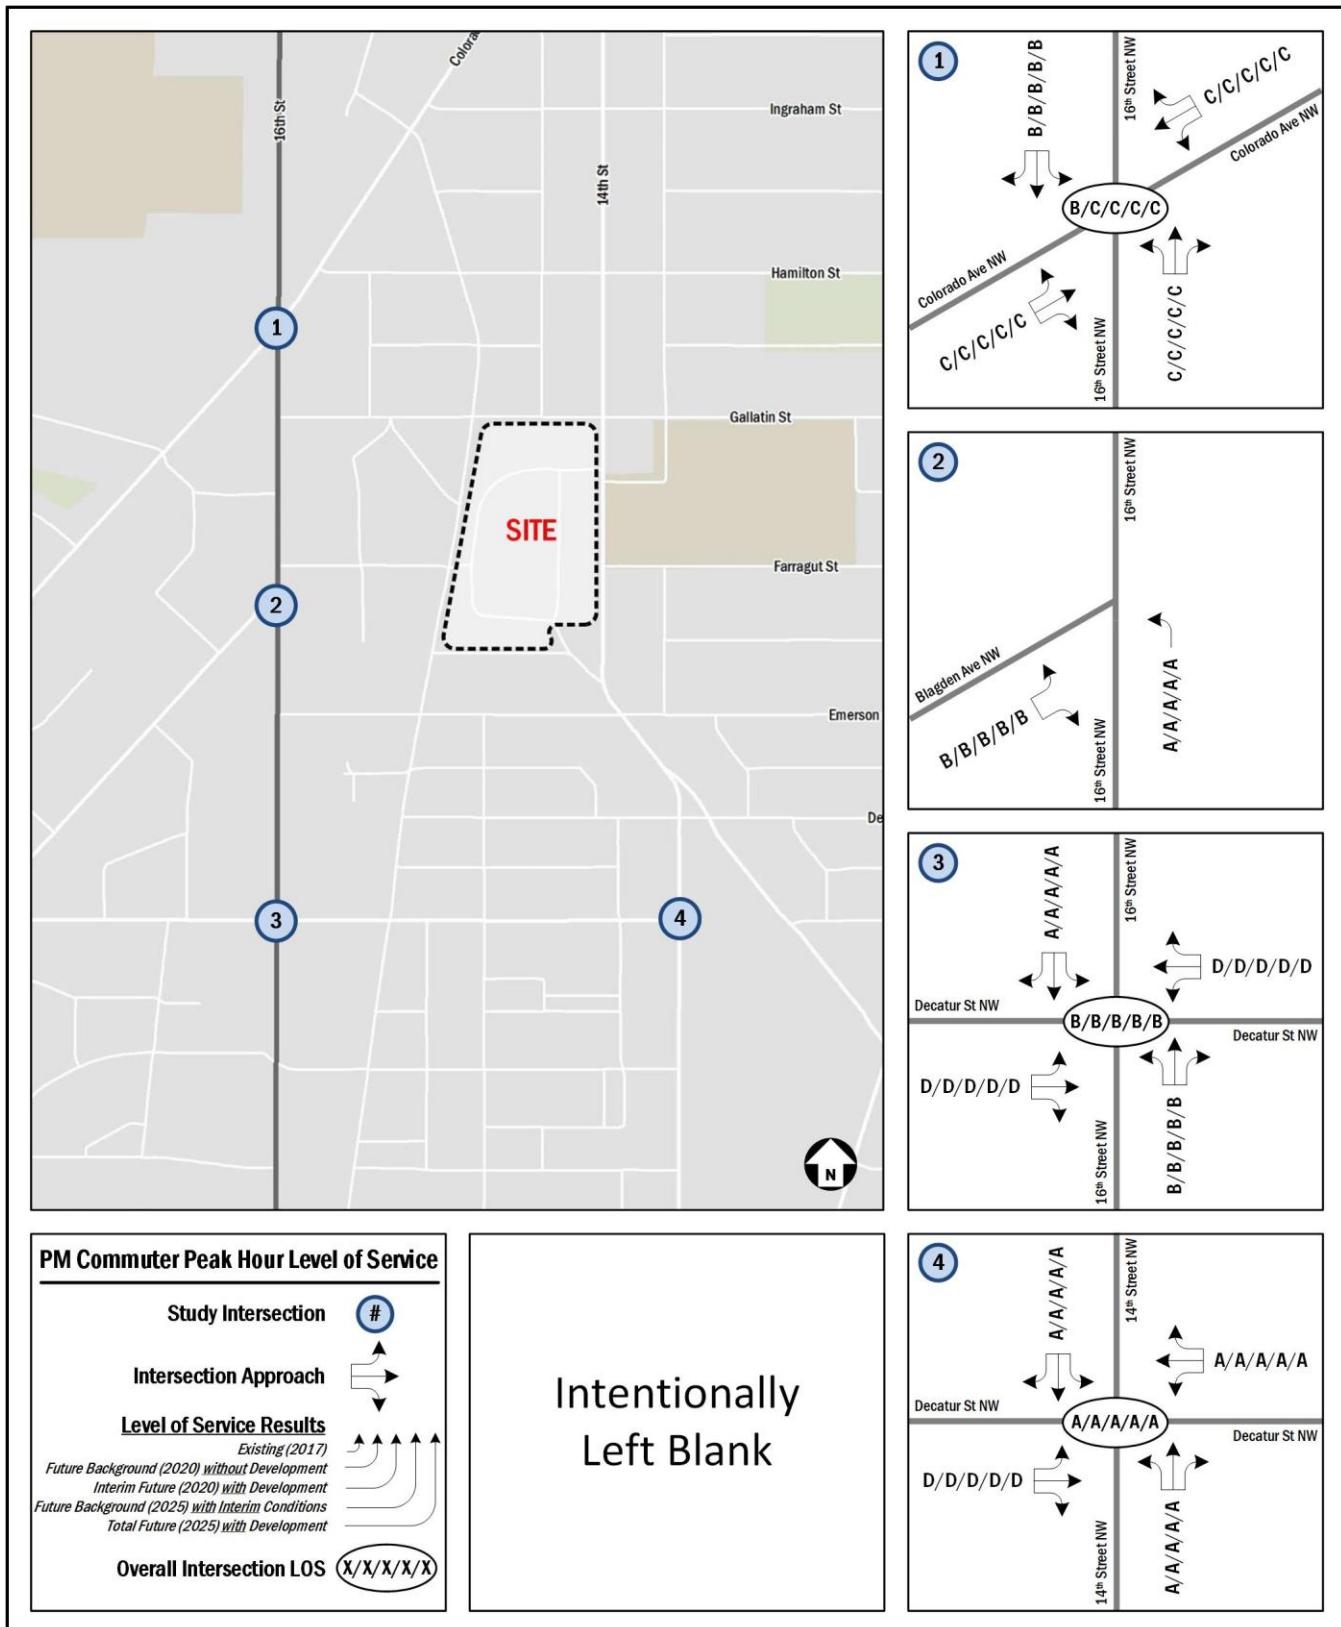

Figure 14: Afternoon Commuter Peak Hour Capacity Analysis Results

## **PEDESTRIAN ENHANCEMENTS**

Given the location of 5000 14<sup>th</sup> Street across the street from West Education Campus, the community and the Applicant are interested in the provision of one or more crossing guards along 14<sup>th</sup> Street, particularly the intersection of 14<sup>th</sup> Street and Farragut Street where 14<sup>th</sup> Street traffic is free-flowing. The concurrence of two schools adjacent to each other and the high percentage of students at both schools that live within walking distance result in a desire for enhanced safety during the peak arrival and dismissal hours.

LAMB is committed to coordinating with West Education Campus and the District to undergo the process for obtaining crossing guards. LAMB will work to undertake the necessary process by filling out a crossing guard request form and submitting it to the Safe Routes to School Coordinator in order to improve the walking environment surrounding the schools. It is understood that this process will begin after the school has opened such that DDOT can evaluate whether there is an observable problem and if the School meets DDOT criteria for obtaining crossing guards.

## **SUMMARY AND CONCLUSIONS**

The following conclusions were made regarding the 5000 14<sup>th</sup> Street NW Supplemental Transportation Review:

- Based on DDOT criteria, the proposed development is not considered to have an impact at any of the additional study area intersections.
- The Applicant is committed to coordinating the process of obtaining at least one crossing guard along the 14<sup>th</sup> Street corridor.
- Overall, this report maintains the conclusions outlined in the full CTR.

## A. LEVEL OF SERVICE DEFINITIONS

All capacity analyses are based on the procedures specified by the Transportation Research Board, Special Report 209: Highway Capacity Manual (HCM), 2000. Levels of service (LOS) range from A to F. A brief description of each level of service for signalized and unsignalized intersections is provided below.

### SIGNALIZED INTERSECTIONS

Level of service is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay associated with each directional movement. The levels of service for signalized intersections are defined below:

- **LOS A** describes operations with very low average delay per vehicle, i.e., less than 10.0 seconds. This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop. Short signal cycle lengths may also contribute to low delay.
- **LOS B** describes operations with average delay in the range of 10.1 to 20.0 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
- **LOS C** describes operations with delay in the range of 20.1 to 35.0 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level although many still pass through the intersection without stopping. This is generally considered the lower end of the range of the acceptable level of service in rural areas.
- **LOS D** describes operations with delay in the range of 35.1 to 55.0 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and/or high traffic volumes as compared to the roadway capacity. Many vehicles are required to stop and the number of vehicles that do not have to stop declines. Individual signal cycle failures, where all waiting vehicles do not clear the intersection during a single green time, are noticeable. This is generally considered the lower end of the range of the acceptable level of service in urban areas.
- **LOS E** describes operations with delay in the range of 55.1 to 80.0 seconds per vehicle. These higher delay values generally indicate poor progression, long cycle lengths, and high traffic volumes. Individual cycle failures are frequent occurrences. LOS E has been set as the limit of acceptable conditions.
- **LOS F** describes operations with average delay in excess of 80.0 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with over-saturation, i.e., when traffic arrives at a flow rate that exceeds the capacity of the intersection. It may also occur at high volumes with many individual cycle failures. Poor progression and long cycle lengths may also contribute to such delays.

### UN SIGNALIZED INTERSECTIONS

At an unsignalized intersection, the major street through traffic and right turns are assumed to operate unimpeded and therefore receive no level of service rating. The level of service for the minor street and the major street left turn traffic is dependent on the volume and capacity of the available lanes, and, the number and frequency of acceptable gaps in the major street traffic to make a conflicting turn.

The level of service grade is provided for each conflicting movement at an unsignalized intersection and is based on the total average delay experienced by each vehicle. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection.

The unsignalized intersection level of service analysis does not account for variations in driver behavior or the effects of nearby traffic signals. Therefore, the results from this analysis usually indicate worse levels of service than may be experienced in the field. The unsignalized intersection level of service descriptions are provided below:

- **LOS A** describes operations where there is very little to no conflicting traffic for a minor side street movement, i.e., an average total delay of less than 10.0 seconds per vehicle.
- **LOS B** describes operations with average total delay in the range of 10.1 to 15.0 seconds per vehicle.
- **LOS C** describes operations with average total delay in the range of 15.1 to 25.0 second per vehicle.
- **LOS D** describes operations with average total delay in the range of 25.1 to 35.0 seconds per vehicle.
- **LOS E** describes operations with average total delay in the range of 35.1 to 50.0 seconds per vehicle.
- **LOS F** describes operations with average total delay of 50 seconds per vehicle. LOS F exists when there are insufficient gaps of suitable size to allow a side street demand to cross safely through or enter a major street traffic stream. This level of service is generally evident from extremely long total delays experienced by side street traffic and by queuing on the minor approaches. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal driver behavior.
